

## CLAIMS

### I CLAIM:

- 1     1.     A rotary actuator comprising:  
2           a housing;  
3           an armature containing a permanent magnet with radially north and south poles  
4           mounted rotatably in said housing;  
5           a plurality of pole members mounted in said housing, with said pole members  
6           journaled around said armature, with said pole members each comprising;  
7           a ferromagnetic material and with at least one of said plurality of pole members having  
8           magnetic properties different than the remaining pole members;  
9           a first stop member mounted on said housing;  
10          at least one stop arm, with said stop arm projecting from said armature and disposed  
11          to engage said stop member to limit rotation of said armature.
  
- 1     2.     The rotary actuator as claimed in claim 1, wherein said housing is made of a  
2           ferromagnetic material and said permanent magnet is made of neodymium, samarium,  
3           cobalt or other rare earth material.
  
- 1     3.     The rotary actuator as claimed in claim 1, wherein at least two of said plurality of pole  
2           members further include a winding thereby forming electro-magnetic poles.

1     4.     The rotary actuator as claimed in claim 1, wherein each of said plurality of pole  
2           members further include:  
3           an air gap formed between each of said plurality of pole members and said armature,  
4           and wherein said at least one of said pole members has magnetic properties different  
5           than said remaining pole members and has an air gap differing in size from each of  
6           said air gaps formed between the respective remaining poles and said armature.

1     5.     The rotary actuator as claimed in claim 1, wherein each of said plurality of pole  
2           members further includes:  
3           a selected shape, with said selected shape of said at least one of said plurality of pole  
4           members having magnetic properties different from the respective remaining pole  
5           members and having a selected shape different than said selected shape of said  
6           respective remaining pole members.

1     6.     The rotary actuator as claimed in claim 1, wherein said at least one of said plurality of  
2           pole members further includes a permanent magnet.

1     7.     The rotary actuator as claimed in claim 1, wherein said least one of said plurality of  
2           pole members includes:  
3           a non-ferromagnetic material pole; and  
4           a permanent magnet mounted on said non-ferromagnetic material pole member.

1     8.     The rotary actuator as claimed in claim 1, wherein said at least one of said plurality of  
2           pole members is made of a non-ferromagnetic material.

- 3 9. The rotary actuator as claimed in claim 1, further including:  
4 an armature spaced relatively close to said housing to create a gap between said  
5 armature and said housing thereby providing additional winding capability on said  
6 pole members for greater drive torque.
- 1 10. The rotary actuator as claimed in claim 1 further including air gap adjustment means,  
2 with said air gap adjustment means disposed on said at least one of said plurality of  
3 pole members.
- 1 11. The rotary actuator as claimed in claim 1, further including a plurality of coil windings  
2 with said coil windings mounted on selected pole members to perform as electro-  
3 magnetic poles.
- 1 12. The rotary actuator as claimed in claim 1, with said at least one pole member movably  
2 disposed relative to said armature.
- 1 13. The rotary actuator as claimed in claim 1, wherein a differential between said magnetic  
2 properties of said at least one of said plurality of pole members and said magnetic  
3 properties of the remaining pole members defines a failsafe torque.
- 1 14. The rotary actuator as claimed in claim 10 wherein said air gap adjustment means  
2 includes a threaded pole member threadably engaged in said housing.

- 1 15. The rotary actuator as claimed in claim 1 further including a second stop member with  
2 said first and said second stop members disposed to limit the motion of said stop arm.
- 1 16. The rotary actuator as claim in claim 1 wherein said magnet is made of alnico.
- 1 17. The rotary actuator as claimed in claim 1 wherein said housing is made of a magnetic  
2 metal and said permanent magnet is made of neodymium, samarium, cobalt or other  
3 rare earth material.
- 1 18. The rotary actuator as claimed in claim 1 wherein at least one of said plurality of pole  
2 members is omitted thereby providing a non-symmetrical configuration of said pole  
3 members relative to said armature.
